

Dear Mayor of Verona and Assessore Polato,

I write to congratulate you on your courageous decision to re-name a park in Verona in loving memory of Marco and Andrea Tremante, innocent victims of the polio vaccine. This initiative is not only brave but highly-significant in today's climate. As the number of vaccines administered rises, there is an ever-increasing number of cases of vaccine damage, from minor short-term ailments to life-long disabilities and even death. Tragically, these devastating complications, compromises and losses of human life are often dismissed by the medical profession as unrelated to vaccines while children and their families suffer. Some of the more debilitating conditions, such as autism, Multiple Sclerosis, autoimmune diseases and cancer, become an enormous burden on our society. Vaccinations are not tested before they are authorized for use. They contain an appalling cocktail of toxic substances including human and foreign DNA, mercury, aluminium, formaldehyde and others all known to cause biological, chemical and even genetic damage to human cells. As more and more officials follow in your footsteps by acknowledging that this practice does not come without risk, independent research should finally be funded in this area. We salute you for taking a stand and showing the world that vaccination is both a topic of great concern and an area in desperate need of independent research.

With great respect and gratitude,

Martin de Munck, chairman of NVKP (Dutch Association for information about vaccinations)
